### Per capita electricity generation (kWh)

- Total
- Renewable

### Renewable capacity in 2018

- Hydro/marine: 37%
- Solar: 63%
- Wind: 5%
- Bioenergy: 3%
- Geothermal: 0%

### Net capacity change (MW)

- Non-renewable: 2013-18: + 29, 2017-18: 0.0

### Capacity utilisation in 2017 (%)

- Fossil: 43%
- Nuclear: 3%
- Hydro/Mar: 18%
- Solar: 13%
- Wind: 13%
- Bio: 13%
- Geo: 0%

### Renewable generation (GWh)

- Hydro/marine
- Solar
- Wind
- Bio
- Geo

Energy efficiency (Energy):

Energy efficiency (Electricity):

**Latest policies, programmes and legislation**

2. Grid-connected Rooftop Photovoltaic Systems project 2010-2014
3. Tax exemptions for renewable energy equipment
4. Seychelles Energy Commission established

**References to sustainable energy in Nationally Determined Contribution (NDC)**

- Renewable energy
  - electricity
  - transport
  - heating/cooling
- Energy efficiency

**ENERGY AND EMISSIONS**

**Energy-related CO₂ emissions by sector**

**Elec. & heat generation CO₂ emissions in 2017**

- Coal + others
- Gas
- Oil

**Avoided emissions from renewable power**

**Reduction in power emissions due to RE in 2017**

- Other Countries
- Seychelles
- Average

Avoided emissions based on fossil fuel mix used for power

Reduction is RE Avoided divided by sum of avoided and emitted
Renewable Resource Potential

Distribution of solar potential

- World
- Seychelles

Distribution of wind potential

- World
- Seychelles

Biomass potential: net primary production

Solar PV: Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country’s land area in each of these classes and the global distribution of land area across the classes (for comparison).

Onshore wind: Potential wind power density (W/m²) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country’s land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

Biomass: Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average of 3-4 tC/ha/yr.

Sources: IRENA statistics, plus data from the following sources: UN SDG Indicators Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

Additional notes: Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. The value of energy trade has been defined as including all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation has been calculated as annual generation divided by capacity x 8,760. Avoided emissions from renewable power have been calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

This note has been produced to provide policy makers with a brief overview of developments in renewable energy in a country. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to statistics@irena.org.
